ABOUT

The StudCaddy is an assistive construction device that reimagines the process of stud welding.

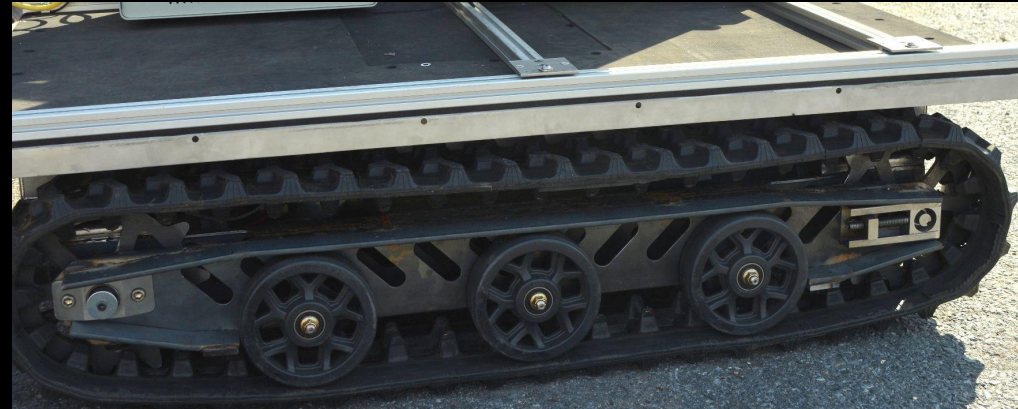

It eliminates the need for bending and awkward postures, improving both **safety and efficiency**. With the push of a button, studs are quickly loaded into an extended stud gun, streamlining the welding process while protecting workers' backs.

Workers simply dump studs into the StudFeeder—no manual loading is needed. The system automatically feeds them into the StudLoader, allowing for continuous operation with minimal effort.

ERGONOMIC & EFFICIENT

The StudCaddy eliminates the need for awkward postures by delivering studs upright and ready. Workers can operate in a safer, more natural stance. Designed for **consistent performance** and **easy reloading**, the StudCaddy maintains high output without sacrificing reliability or worker well-being.

UNMATCHED MOBILITY

The SiteRunner mounting platform combines wireless remote control with a heavy-duty design, effortlessly maneuvering the StudCaddy anywhere on the jobsite. Weld with **ultimate flexibility and efficiency**.
